John C. Cavanaugh, Ph.D.

Associate Provost for Graduate Studies

## ACKNOWLEDGMENTS

If the work in your hands is a success, it is thanks to the help of many people.

My deep gratitude is to Dr. Jin Wu who, in spite of the very long distance between our working places, always found the right arguments and words of encouragement, and to Dr. Pablo Huq who agreed to be chairman of the committee at very short notice. The long, constructive discussions with him were a pleasure. I am also very grateful to the other members of my committee, Dr. Dennis Trizna and Dr. Frank Hall. I took to heart Dr. Trizna's advice to "Use your intuition". Dr. Hall's interest and grasp of physics are much appreciated.

There is a very special "thank you" to Dr. Shih Tang. He was engaged in all day-to-day details of this research, with its ups and downs, both friendly and heated. The spirit of our relations was that of support, encouragement and understanding. Dr. Tang exemplifies hard work, enthusiasm, and unselfish dedication.

I am grateful to Doris Manship and Peggy Conlon, who handled my administrative panic with a professional calm, and to Jackie Binette, who could recognize my low mood at a glance and always found a way to cheer me up.

Thanks also to the colleagues in the Air-Sea Interaction Laboratory: Shiou-Wen Chen, Zhi Yang, Rich Barber, Ron Lee, Jack Ting, Shunli Lou, Mark Bourassa, Dr. Wo,

Dr. Hou, and Dr. Meng Zhao for the amicable atmosphere at the working place. The laboratory is sad without the congenial Ray Romano's laugh and benevolence.

I am a gregarious person and am grateful to old friends and new for their support. My faithful friends in Bulgaria – Tanja, Elena, and Fori, and also Plamen, Mario, Bratan, Velcho, Rusi, Chris, Bistra, Nina, and Svilka – kept in touch with warm and loving letters allowing me to “participate” in all their important and joyful moments. New friends – Hugh, Kim, Amy, and Kathy – shared laughter, movies, and bottles of wine. I will cherish the good times and conversations with Matt, Jim and Juanita, Steve and Melissa, Niels, Cecily, Lexia, Carol, Ray, Geremea and others students in the College.

The very greatest thanks are for my best friend, colleague and husband Andrey and my stormy son Constantin. I hope Cosio will forgive me some day for the cost of this work: the many lonely afternoons, weekends that were no fun, and the constant pressure to manage with many things. I will never have enough words to say “thank you” to Andrey. He is the center of my world, the source of love and care, security and fun, tolerance and confidence. He is the only person who can deal with my bad mood, doubts and worries, and also my excessive excitement, talkativeness and noisiness in happy moments. Andrey, thank you!

I am enormously thankful to my parents Donka and Dimitar and my brother Petar for their unconditional love, understanding and moral support. Whatever difficulties they had they never complained, always coping and keeping optimistic. They gave me their strength to pursue my goal. This work is dedicated to them.

To all of you and all that I certainly, but unwillingly, miss – THANK YOU!!!

## ABSTRACT

Understanding bubble clouds can be helpful in elucidating the dynamics of the upper-ocean boundary layer (Thorpe, 1992). The effects are subtle; for example void fractions as low as 1% can reduce the sound speed in water by an order of magnitude (Lamarre and Melville, 1991). The models of bubble mediated gas transfer depends on reliable estimates of the initial bubble size distribution (Melville et al., 1995). While many studies have been done on the population and general description of microbubbles already dispersed in the near-surface layer, few investigations have reported on bubble clouds. A systematic parameterization of the bubble clouds characteristics under various and well-controlled conditions is necessary.

A laboratory study of bubble clouds produced by breaking waves under various wind velocities in both fresh and salt waters and at different water temperatures is presented. Video imaging technique is employed. Reported parameters of interest are: the spatial and temporal evolution of cloud shape, penetration depth, void fraction. The possibility of obtaining bubble size distributions from measured void fraction is investigated.
